

From the 6 a.m. bake to the closing till.

One system that plans the day's production, receives the supplier's lorry, prices the shelf, bills the counter — online or offline — and closes the books. Built for bakeries and supermarkets that have outgrown a billing package.

130+ screens in production

35 operational reports

24 accounting screens

the till bills offline

Android app for the shop floor

every franchisee its own tenant

8 languages

Software should follow the shop, not the other way round.

Here is an ordinary day in a three-outlet bakery and supermarket, and where TradeLink247 is standing at each hour.

05:30 Production planning Yesterday's sales shape today's batch. The plan is raised against a recipe defined once in Production Definition.	06:45 Production execution Actual output is recorded. Flour, sugar and butter leave raw-material stock automatically; finished goods arrive already costed.
07:30 Goods receipt The supplier's delivery is checked in against the purchase entry. A short supply is corrected through an approval trail, not an eraser.	08:00 Shelf pricing Branch price and category-wise price edits set today's rates. A tax change is previewed in full before it is committed.
08:30 Transfer to outlets Bread moves to the two satellite shops. Each destination sees a pending transfer-in it must accept, so nothing vanishes in transit.	09:00 – 22:00 The counter Barcode or name search, weighed items, schemes applied live, UPI or cash, silent thermal print. If the line drops, billing carries on.
22:15 Day end One screen: total sales, payment-mode split, quantities sold, cash to bank. Day-end rules are set per branch by head office.	Overnight The system thinks Reorder suggestions, stock anomalies and margin movement are waiting before the owner opens the laptop at six.

A bakery is a factory. A supermarket is a warehouse. Most owners run both.

Plenty of retail software handles the till and calls itself an ERP.

TradeLink247 was built from the production side inward — which is precisely where food retail loses money without noticing.

Know what a batch actually cost you

Recipes, planning, execution and consumption are proper transactions here, not a note in a diary.

- **Production Definition** — the bill of materials for every finished item, held in one place.
- **Planning and Execution** — plan against demand, record real output, consume raw material automatically.
- **Cost and Profit Stamping** — every sale carries the cost it was made at, so margin is a fact rather than a month-end estimate.
- **Item Cost Override and Cost Price History** — when butter jumps twelve percent, you can see exactly which products stopped being profitable, and from which day.
- **KOT** — counter and café orders raised for the kitchen, converted to a bill when the customer pays.
- **Central kitchen to outlets** — transfers accepted at the receiving end, with an item transfer report that shows what never arrived.
- **Physical Stock Correction** — wastage and returns adjusted honestly, without inventing a purchase to cover them.

Thousands of lines, priced and counted correctly

Wide catalogues, thin margins and tax that has to reconcile. The operational detail is where this system earns its keep.

- **A fast counter** — barcode scanning, name search, keyboard shortcuts, sales return, multiple payment modes, UPI collection.
- **Weighing integration** — serial-port weighbridge and weight-count capture straight into the transaction.
- **Category hierarchy** — type and name (FMCG, then Beverages), with price editing across a whole category at once.
- **Tax Update Manager** — bulk GST rate changes with a full preview before anything is committed.
- **Schemes** — free quantity, item discount or cash back, triggered by bill value or quantity, published centrally and applied live at every till.
- **GST-ready reporting** — HSN-wise sales and purchase, sales tax summary and HSN summary for input-credit reconciliation.
- **Turnover, Velocity and Anomaly** — find the dead stock, the fast movers, and the counts that do not add up.

The whole business, in modules you switch on as you grow.

Everything below is live software in daily use, not a roadmap slide.

Menus are granted role by role, so a cashier and an owner open two different applications.

SELLING

Billing and POS

A Windows till that keeps trading when the internet does not. Sales queue locally and sync the moment the server is reachable.

POS and KOT

Sales return

UPI payment

Receipt modes

Print settings, silent print

Counter shortcuts

Day-end close

Machine approval and live terminals

BUYING

Purchase and receiving

Purchase entry, physical goods receipt, and corrections that pass through approval and leave a history behind them.

Purchase entry

Goods receipt

Correction, approval, history

Supplier master

Supplier statement and aging

HSN-wise purchase

MAKING

Production

Definition, planning and execution, with raw-material consumption and finished-goods costing handled by the system.

Production definition

Production planning

Production execution

Planning report

Execution report

HOLDING

Inventory and stock

One truth about quantity and value, per branch, with the ledger to prove how it got there.

Item master and search

Branch price

Physical stock correction

Transfer in and out

Stock movement and turnover

Item velocity and movement

Branch inventory ledger

Stock anomaly

COUNTING

Accounting

A real double-entry ledger sitting behind operations, so the trading figures and the financial statements are the same numbers.

Ledger accounts and setup
Receipt and payment entry
Trial balance
Profit and loss, balance sheet
Cash flow
Customer and supplier aging
Bank reconciliation
Stock valuation
Budget manager, budget vs actual
Period closing

SCALING

Multi-branch and franchise

Head office keeps control of masters and prices; each outlet or franchisee runs its own day without seeing anyone else's numbers.

Branch creation and assignment
Branch permission transfer
Per-branch day-end rules
Franchise master and users
Master sync
Franchise stock transfer
Event monitor
Migration utility

CONTROLLING

Access and governance

Who may see what is configuration, not code. Corrections, approvals and versions all stay on the record.

Menu master and roles
Role-menu access
Report exclusions
Voucher reprocessing
Version management
Documents list
Financial year and bill series

ADAPTING

Tools and design

Make the software match your paperwork, instead of reprinting your paperwork to match the software.

Invoice designer
Workflow designer
Workflow instances
Bulk upload and download
Global menu search
Feature map

ANSWERING

Reporting

Thirty-five operational reports across sales, purchase, stock, production, profit and daily operations — each filterable by branch and date, and exportable.

Single branch and all-branch
Category-wise and item-wise
Season and salesman
Branch and monthly profit
Day end and bill series

The stock check should happen where the stock is.

The TradeLink247 Android app puts the three things a floor manager actually needs onto the phone already in their pocket. No terminal, no printout, no walking back to the office to look something up.

LIVE TODAY

Stock check at the shelf

Look up any item and see what you are holding — at this branch and at every other one. The question of whether the other shop still has it is settled in ten seconds, standing in the aisle, instead of by a phone call to a cashier who is busy billing.

LIVE TODAY

Sales by branch

The day's trading per branch, on the owner's phone, whenever they want it. No laptop, no waiting for the evening report, no ringing round the outlets at closing time to ask how the day went.

LIVE TODAY

Stock taking by barcode

Walk the aisle, scan with the phone camera, enter the count. Lines flow straight into physical stock correction on the server, so a stock take closes the same evening rather than being typed up over the weekend.

IN DEVELOPMENT

Stock taking from a shelf photo

Photograph the shelf and let the system identify the products and count the facings, so the counter confirms a number instead of entering one. Aimed squarely at the long tail — the hundreds of lines nobody has time to scan one at a time, which is exactly where a stock take normally goes wrong.

A franchisee is not a branch, and the software should stop pretending otherwise.

A franchisee buys from outside suppliers, pays its own staff, keeps its own accounts and answers for its own profit. Run it as another branch and the two sets of books contaminate each other. In TradeLink247, every franchisee is provisioned as a separate tenant with its own database — and head office still sees everything.

STEP 1 Create the franchise Code, name, owner and contact, address, tax registration and plan, entered once by the central administrator.	STEP 2 The tenant is provisioned A separate database is created and migrated automatically. You watch it move through provisioning to active, and a failure is reported rather than half-completed.
STEP 3 Defaults are seeded An administrator account, roles and menus, the financial year and a starting chart of accounts — so the franchisee logs into a working system, not an empty one.	STEP 4 Masters flow down Items, categories, tax rates, HSN codes and barcodes sync from head office. The franchisee never re-keys your catalogue, and never invents its own version of it.

The franchisee's suppliers, purchases, expenses, customers and profit and loss live in their database. Yours live in yours. They are never mixed, and no franchisee can see another.

Head office keeps consolidated visibility across all of them — that separation is the point of the design, not a limitation of it.

TRANSFER PRICE Supply at cost, at a standard rate, or at a custom percentage you set for that franchisee. Change it for one without touching the rest.	CREDIT LIMIT A dispatch can be blocked when the franchisee is over their limit — checked by the system at the moment of transfer, not discovered at month end.
OUTSTANDING CHECK Stop supplying a franchisee who has not paid, automatically and without an awkward phone call from the despatch clerk.	APPROVAL Require a named approver before stock leaves for a franchisee, so nothing goes out on a verbal instruction.
WHAT THEY MAY BUY Restrict which item categories a franchisee can be supplied, and which of your branches may supply them.	VALIDITY Every arrangement carries effective-from and effective-to dates, so a seasonal or trial agreement expires on its own.
STATUS A franchise can be suspended or terminated centrally. Access and supply stop with it; the history stays.	THEIR OWN BUYING Where you allow it, a franchisee purchases from outside suppliers into their own stock and their own accounts, and you still see the summary.

WHEN THE NETWORK IS THE BUSINESS

TWO-SIDED TRANSFERS Stock leaving the centre is not stock received. A transfer moves through pending, dispatched, received or rejected, and the franchisee's stock rises only on confirmation.	NOTHING SYNCs SILENTLY The event monitor shows every cross-tenant message, including the ones that failed, with the payload and a retry. Sync is idempotent, so a retry cannot double-apply.
MASTER SYNC YOU CAN AUDIT A dedicated screen reports what was pushed to each franchisee and what failed, rather than leaving you to discover a stale price at the till.	START WHERE YOU ARE Already running franchisees as branches? The migration utility moves them to their own tenant when you are ready. Existing branches carry on working throughout.

The difference between a system that records and a system that tells you something.

Retail data is worth only what somebody notices in it. These features do the noticing, and they are the usual reason owners move to us from a conventional billing package.

AI Stock Intelligence

LIVE TODAY

Reorder suggestions per branch, each with an urgency level, a confidence score and the reasoning behind it. Approve or reject in one click and export the approved list as your purchase plan. It catches the slow drift — the line that quietly stopped selling in one outlet while still moving in the other.

AI Report Assistant

LIVE TODAY

Ask in plain language — bread sales at the main branch last week against the week before — and get the report. Correct it once and the assistant keeps the correction. Staff who will never learn a report menu can still get an answer.

Product 360

LIVE TODAY

One product, every branch, one screen: what was purchased, what was produced, what moved between outlets, what sold, and what it earned. The view you want when a product looks wrong and nobody can say why.

Insights

LIVE TODAY

The system raises what changed — by branch, by type, by severity — instead of waiting to be asked. Margin slipping, stock behaving oddly, one shop out of line with the rest.

Invoice Reader

LIVE TODAY

A supplier invoice read into purchase entry lines. Less typing at the receiving door, and fewer keying errors buried in your cost price.

Near-expiry watch

ON THE ROADMAP

Batch expiry captured at goods receipt, then a daily list of what must be sold, discounted or pulled. In perishable retail this is the single most valuable alert a system can raise.

Budget alerts

ON THE ROADMAP

Branch expense budgets that flag as they are being breached, on top of the budget-versus-actual reporting already in the product.

Reports already written, not a report builder you will never use.

These ship configured, branch-aware and export-ready on day one.

SALES

Engineered for shops, not for data centres.

KEEPS TRADING

Offline-first counter

Bills are written locally and synced automatically. A pending badge on the till shows how many are waiting, so nothing is lost and nobody has to remember.

YOUR DATA

A database per business

Multi-tenant by design with per-tenant isolation, so your figures never share a table with another retailer's.

HARDWARE

The equipment you own

Thermal receipt printers with configurable paper size, barcode scanners, cash drawer, serial-port weighbridge, UPI collection.

YOUR PEOPLE

Eight languages

English, Hindi, Malayalam, Tamil, Telugu, Kannada, Arabic and French, so counter staff work in the language they think in.

BRANCHES

Event-driven sync

Masters, prices and stock movements propagate between head office and outlets on an event stream, with a monitor showing what synced and what did not.

CORRECTIONS

Approval, not deletion

Purchase corrections are requested, approved and kept in history. Vouchers can be reprocessed. The trail outlives the argument.

GROWTH

Franchise-ready

Onboard a franchisee as its own tenant, with its own users, centrally controlled masters, inter-tenant stock transfer and a migration utility.

FIT

Your bill, your process

Design the printed invoice yourself, and model an approval flow in the workflow designer without waiting for a software release.

Trading on the new system inside a month.

Guided setup follows the order that actually works: financial year first, because voucher numbering depends on it, then masters, then stock, and the tills last.

WEEK 1

Foundation

Company and financial year, branches with permanent codes, roles and menu access, users assigned to the branches they work in.

WEEK 2

Your catalogue

Item master, categories, tax rates, barcodes and HSN codes uploaded in bulk. Suppliers and expense heads created.

WEEK 3

Opening position

Opening stock and cost prices loaded, branch pricing set, recipes defined for the bakery, schemes configured, invoice format designed.

WEEK 4

Counter and go-live

Tills approved and paired, printers and scanners tested, cashiers trained on one screen, a parallel run, then live.

See it running on your own item list.

Send us a day of your sales and a sample of your catalogue. We will set up a demo with your products, your prices and your branches, so you are evaluating your own business on the system rather than a showroom dataset.
